## SUMMARY

Fast learning, detail-oriented climate data scientist with a background in computational earth science research. Highly qualified with python data science modules for visualization, wrangling, and statistical analysis of climate model and remote sensing data.

## EDUCATION

### Colorado State University

M.S. candidate in Hydrologic Science & Engineering

Fort Collins, CO

August 2023 – present

### University of California at Berkeley

B.A. in Atmospheric Science

Berkeley, CA

Dec 2020

- Honors thesis: *Evaluation of a simple parameterization of the Evaporative Stress Index using FLUXNET data and a planetary boundary layer model* (advised by Prof. Dennis Baldocchi)

## PROFESSIONAL EXPERIENCE

### Eagle Rock Analytics

Junior Atmospheric Scientist (remote)

Sacramento, CA

June 2022 – August 2023

- Developed open source python code (a collection python notebooks and a related python package: *climakitae*) for the Cal-Adapt: Analytics Engine, a cloud-based climate data analytics platform for California's energy sector.
- Solicited continual feedback from industry stakeholders throughout development to ensure the utility of the product to our user base.

### School of Public Health at the University of California, Berkeley

Junior Specialist (half-time)

Berkeley, CA

Jan 2021 – Feb 2022

Undergraduate Student Researcher

Oct 2020 – Dec 2020

- Calibrated a wind erosion model in California using remote sensing-derived vegetation data.
- Performed data extractions and zonal statistics using python and R for various environmental datasets used in public health studies utilizing a high performance computing environment.

### University of Maryland / NASA Goddard Space Flight Center

Faculty Research Assistant (half-time, remote)

Greenbelt, MD

Jan 2021 – Jan 2022

NASA Summer Intern (remote)

June 2020 – Aug 2020

- Built an interactive Jupyter Book (a collection of python notebooks) to evaluate drivers of winter Arctic sea ice growth using gridded data from NASA's ICESat-2 satellite.
- Contributed to the development of a cloud-optimized python toolkit to streamline polar climate model validation using satellite data. Project emphasized interactive plotting techniques and data management with Google Cloud.

### University of California, Berkeley, College of Natural Resources

Undergraduate Student Researcher

Berkeley, CA

Oct 2019 – Dec 2020

- Utilized eddy covariance flux measurements and a planetary boundary layer model to evaluate a drought index using python data science packages. Research contributed to my undergraduate honors thesis and a related publication.
